API Testing for Performance and Security

For Performance Testing:

- Set up performance tests to simulate multiple users hitting your API
- Add response time assertions to ensure your API meets performance benchmarks
- Configure load testing with virtual users to test under stress

For Security Testing:

- Add security-focused test scripts to check for:
 - Proper authentication/authorization
 - HTTPS enforcement
 - Secure headers (CORS, CSP, X-Frame-Options, etc.)
 - Input validation
 - No sensitive data exposure in responses
- Test for common vulnerabilities

Let me ask you a clarifying question: Would you like me to start with:

- Performance testing - setting up load tests and response time checks?
- Security testing - adding comprehensive security validation scripts?
- Both - I can set up a complete testing suite covering both areas?

Also, is this API running locally for development, or do you have other environments (staging/production) you'd like to test against?
